Culvert Inspection and Ratings

Introduction

- Bridge sized culverts have an equivalent diameter of 1500mm or greater
- Bridge site that requires a 1500 mm pipe due to hydraulic discharge
- Will routinely inspect smaller culverts if there are several (low level crossing)
- May also inspect if multiple small culverts are equivalent in hydraulic capacity to bridge-sized (2-1200mm)
- May inspect certain other non-bridge sized culverts (3 - 900mm)

 Alberta
Transportation

Technical Standards Branch
Class B Bridge Inspection Course
 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Introduction

- Many different types of culverts – refer to Table 1.1 in Manual
- Vast majority are CSP or SPCSP in various shapes - round, arch pipe, horizontal ellipse
- Three culvert forms (Cul1, CulE, CulM)
- Same forms used for all types of culverts
- Timber pipe (TP) culverts exception
 - Use TT form

 Alberta
Transportation

Technical Standards Branch
Class B Bridge Inspection Course
 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Form Types

- CUL1
 - Single culvert or single culvert extended with same material and size
- CULM
 - Two or more culverts (MP, SP or BP etc.)
 - Includes 1 Upstream & 1 Downstream End section for each Barrel section
 - Exception is Concrete Boxes (BP) where single U/S and single D/S sections for all barrel sections
 - Includes 2 cell box extended with single steel
- CULE
 - Single culvert extended with different material and/or size
 - One Upstream & Downstream section, Barrel sections for all cells and/or pipes

Culvert Inspection and Ratings

Inventory Information

Bridge Culvert Information

Bridge Culvert Information							
Number of Culverts		1					
Pipe #	Barrel	Span	Rise (or Dia.)	Type	Length	Corr. Profile	Pt/Stab Thickness
1	MAIN	1800	MP	33	125X26	2.8	ROUND
Special Features							
Special Features Comment							

- Extracted from BIS
- Span/rise is original design shape
- If round then only rise is recorded
- Span types – refer to Table 1.1 and Sec. 13.2.3
- Corrugation Profile and Plate Thickness selected from Table 13.1 and 13.2 (p.13.5 in manual)
- Specific information is provided for all pipes
 - a culvert extended with same material and size is considered to be one culvert (Cul1)

BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Culvert Inspection and Ratings

Culvert Inspection and Ratings

Numbering and Identification

- Primary span is the largest span at the site
- Secondary span is the smaller span
- Multiple culverts of same dimension are numbered in order of increasing chainage (from south to north or west to east)
- Multiple culverts also have same Ring numbering system (R1, R2, R3, etc.)

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - General

- Individual rating sections for the Upstream and Downstream ends
- Single upstream and downstream end sections for the CUL1, CULE forms
- Separate Upstream and Downstream ends for each Barrel section on CULM forms - except Concrete Boxes
- Upstream and Downstream sections are identical
- Items are inspected and rated the same way for both ends

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - General

Downstream End

Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - End Treatment

- Purpose:
 - Improve aesthetics
 - Improve hydraulic performance
 - Prevent undermining due to scour
 - Prevent scour of the embankment
 - Reduce piping along or under the culvert
 - Resist uplift due to buoyancy forces
 - Shorten the culvert
 - Stiffen the ends

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment -Types

- Steel:
 - Most common
 - Bevel end with no concrete treatment
- Concrete
 - Presence of any or all of: Headwall, Collar, Wingwall, Cutoff Wall
- Other
 - Timber Culvert with Timber End Treatment
- None
 - Square end – no Bevel present

 Alberta Transportation

Bevel End with Full Concrete End Treatment - Type is “Concrete”

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Headwall

Downstream End			
Culvert Component	Last	Now	Explanation of Condition
Headwall			

- Located over the crown
- Usually attached to the barrel
- Purpose:
 - Aesthetics
 - Strengthen end
 - Resist buoyancy force
 - Retaining walls

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
16

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Headwall

- Look for:
 - Signs of movement or tilting
 - Loose connections
- Rate according to condition of material and functionality of component
- Condition affecting functionality rate 4 or less

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
17

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Collar / Slope Protection

Downstream End			
Culvert Component	Last	Now	Explanation of Condition
Collar/Concrete Slope Protection			

- Located along the beveled slopes of flexible culverts between headwall and cutoff wall
- Usually constructed from concrete
- Usually used with and connected to headwall and cutoff walls
 - May be used alone

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
18

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Collar / Slope Protection

- Purpose:
 - Aesthetics
 - Stiffen the bevel
 - Resist buoyancy force
 - Improve hydraulic efficiency of end
 - Concrete slope protection
 - protect against scour / erosion
 - reduces piping potential

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
19

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Collar / Slope Protection

- Look for:
 - Evidence of piping or scour / erosion
 - Loose connections
 - Voids underneath or settlement
- Rate according to condition of material and functionality of component
- If piping, rate 4 or less:
 - Also rated under bevel end and barrel

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
20

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Wingwalls

Wingwalls	5	5	Both wings pushing towards streambed. North wall is 100 mm at top and 65 mm away from barrel worst of all four corners.
(Shape : FLARE)			

- Generally found at culverts that do not have bevels
- Shape is either Parallel or Flared to culvert axis
- Main difference from Bevel is Wingwall is not attached to the barrel
- Usually constructed from concrete or steel
- Purpose
 - Improve hydraulic efficiency
 - Retain embankment fill

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
21

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Wingwalls

- Record Shape as “Parallel”, “Flare”, or “Perpendicular” (to culvert axis)
 - Parallel wingwall
 - Req’ less scour protection between walls
 - Flared wingwalls
 - more hydraulic efficient
- May have a reinforced concrete slab between
 - Prevents undermining of wingwalls due to scour
 - Act as struts for greater stability
 - If present rate with wingwalls

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
22

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Wingwalls

- Look for:
 - Evidence of movement
 - Loose connections (gap at barrel)
 - Scour / erosion at toe or behind wingwall
- If wingwall is unstable rate 4 or less
- Separation losing fill rate 4 or less
- Includes rating of wingwall floor slab

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
23

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment – Flared Wingwalls

Alberta
Transportation

Technical Standards Branch
Class B Bridge Inspection Course
24

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Cutoff Wall

Downstream End			
Culvert Component	Last	Now	Explanation of Condition
Cutoff Wall			

- Located at the end of the culvert
- Vertical wall extending down below the bottom of the culvert
- Depth exceeds the depth of the riprap or concrete apron
- Usually constructed from concrete or steel
- Purpose:
 - Reduce potential for undermining of end of culvert
 - Minimize possibility of piping
 - Resist buoyancy force

Alberta
Transportation

Technical Standards Branch
Class B Bridge Inspection Course
25

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

End Treatment - Cutoff Wall

- Look for evidence of:
 - Undermining
 - Piping
 - Uplift
 - Loose connections
- Usually not possible to inspect since they are submerged or covered with ice or debris
 - If not visible rate "N"
 - If certain not present rate "X"
- If piping, rate 4 or less
 - May also affect Bevel End and Barrel Rating

Alberta
Transportation

Technical Standards Branch
Class B Bridge Inspection Course
26

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Alberta
Transportation

Technical Standards Branch

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Bevel End

Downstream End			
Culvert Component	Last	Now	Explanation of Condition
Bevel End			
Heaving (mm)			
Invert Above/Below Stream Bed			
Above/Below (mm)			

- Sloped section at the end of the culvert
- Permanently attached to the barrel
- Generally parallel to the culvert axis
- Bevel types
 - Full bevel
 - Step bevel

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
28

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Bevel End

- Compared to projecting ends, bevel ends are more:
 - Aesthetic
 - Economical
 - Hydraulically efficient
- Compared to projecting ends, bevel ends on corrugated steel culverts are more flexible and susceptible to:
 - Deform due to lateral earth pressure
 - Uplift due to buoyancy
 - Heave due to frost action

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
29

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Bevel End

- Measure or estimate heaving of bevel and record amount

- Often best place to estimate is from inside barrel looking back to Bevel
- Use waterline as level
- Some heave is tolerable as long as water is entering Bevel

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
30

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Bevel End

- If possible, measure or estimate height above or depth below streambed and record amount in mm. (may not be able to measure or confirm measurements in high water or winter).
- Normally “Below” as designed to be buried $\frac{1}{4}$ diameter below streambed.
- If invert is “at streambed” record Above/Below as 0mm.
- Find a representative natural streambed location
 - Discount presence of localized scour hole or deposits (aggrading) at end of culvert

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
31

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Bevel End

Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
32

BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Bevel End

- Look for:
 - Piping
 - Deformation
 - Impact damage
 - Corrosion that affect strength
 - Abrasion
- If piping, rate 4 or less
 - Also rated under End Treatment if present
- Defects/deformations not affecting function rate 6 or less (un-supported bevel - no heave)
- Severe corrosion affecting strength (perforations) rate 4 or less – otherwise corosions should not affect rating
- If no bevel, rate "X"
 - Underpasses often have square ends

Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
33

BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Bevel End

Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
34

BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Scour Protection

Scour Protection	8	
(Type : RIP RAP)		
(Avg. Rock Size(mm) : 600)		

- Usually heavy rock riprap
- The current version of Std. Drawing S-1418-03 shows the minimum requirements for riprap
 - Coverage
 - Size
 - Minimum thickness
 - Gradation

<http://www.transportation.alberta.ca/4860.htm>

Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
35

BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Scour Protection

- Purpose is to prevent scour and erosion at culvert ends which may:
 - Undermine the culvert
 - Undermine the sideslopes
 - Cause the formation of sand bars

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
36

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Scour Protection

- Record the type of Scour Protection
 - If none exists and none is required, record type as "NATURAL"
 - If none exists and some is required, record type as "NONE"
- Estimate and record the average size (rock only)
- Look for:
 - Durability of riprap - e.g. sandstone is not acceptable
 - Shape – flat rocks not desirable
 - Displacement or movement
 - Scour
 - Current standards on S- 1418

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
37

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Scour Protection Ratings

- No scour/erosion or displacement rate 7 or more
- If none exists and none is required record type as "NATURAL" and rate 7 or more
- If none exists but is required record type as "NONE" and rate 4 or less (also make recommendation)
- Generally not rated higher than Scour rating – especially when Scour is 4 or less
- Protected area is smaller than required or rock gradation or quality is inadequate rate 4 or less
- Concrete protection with excessive settlement or undermining rate 4 or less
- Cattlepasses that handle drainage rate – otherwise X

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
38

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Scour / Erosion

Downstream End			
Culvert Component	Last	Now	Explanation of Condition
Scour/Erosion			

- Removal of material from the streambed, banks or sideslopes by the action of flowing water and/or constrictions or obstructions (refer to Section 16.2 in manual).
- Effects:
 - Undermine the culvert
 - Undermine the sideslopes
 - Impede fish passage
 - Alter culvert hydraulics

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
39

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Scour / Erosion

- Two types:
 - General – uniform lowering of original stream
 - Local – occurring at specific locations
- Look for:
 - Scour holes, especially at downstream ends
 - Undermining of culvert end or sideslopes
 - Slumping of sideslope or banks
 - Areas where flow impinges on banks, sideslopes or protection systems
 - Areas susceptible to high velocities and undermining
 - culvert footings
 - ends or bottoms of wingwalls and cutoff walls
 - sides of collars
 - ends or bottoms of ends of protection systems

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
40

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Scour / Erosion

- Rate the presence and extent of scour and adverse effects on culvert, embankment, streambed and banks
- If culvert and embankment are not affected, rate 5 or more
- Scour/erosion affecting culvert, rate 4 or less

 Alberta Transportation

Technical Standards Branch

Ends - Beaver Activity

Channel (U/S and D/S)	Structure Usage		Explanation of Condition
	Last	Now	
Alignment	5	5	
Bank Stability	5	5	
HWM (m below Top of Culvert)	(High water 1.2m above streambed @ outlet.) No visible HWM.		
Drift (Y/N)	Yes	Drift on floor of R1-R4	
Channel Bottom Degradation (grading)	DEGRADING	At D/S only	
Beavers (Y/N)	Yes	Beavers at both U/S and D/S	
(Fair Compensation Measure 1 : NONE)			
(Fair Compensation Measure 2 : NONE)			
Channel General Rating	5	5	

- Beavers frequently construct dams at inlet or inside culverts
- Effects:
 - reduced flow capacity
 - Flooding upstream
 - Scour
 - Ponding of water inside culverts preventing inspection

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
44

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Ends - Beaver Activity

- Indicate the presence of beaver dams in or near the culvert by Yes or No
- If “yes”, provide comment
- No rating required but may affect
 - End General Rating
 - Scour
 - Waterway Adequacy in Barrel section

 Alberta Transportation

Technical Standards Branch

- Governing elements: (Refer to 1.10.7 & 13.5.10)
 - Headwall
 - Collar
 - Wingwall
 - Cutoff Wall
 - Bevel end
 - Scour protection
- If all are rated “X” then provide rating based on general condition of culvert end

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
46

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Rigid Types

- Made from concrete or timber
- Designed to carry loads without deflection (Rise and Span measurements normally not necessary).
- Culvert carries entire load with no reliance on surrounding fill for support.
- Generally more expensive but more durable, last longer and require less structural maintenance.

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
47

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Flexible Types

- Made from corrugated steel
- Low strength
- Dependent on surrounding backfill for support
- Culvert deflects under load until the backfill picks up the stress
- Entire load carrying system cannot be inspected directly (I.e. can inspect culvert but not backfill)
- Flexible culverts more susceptible to failure by:
 - Change in shape due to excessive deflection
 - Defective joints - cracks, open joints, cusped seams, etc.
 - Severe corrosion
 - Uplift of ends due to buoyancy forces

Technical Standards Branch
Class B Bridge Inspection Course
48

Culvert Inspection and Ratings

Barrel - Ring

- Different elements make up a complete ring:
 - Roof
 - Sidewall
 - Floor
 - Bolted or riveted seams
 - Circumferential seams (bolted (SPCSP) or external coupler (CSP))
- Purpose:
 - Carry water flow or traffic
 - carry loads and transmit to surrounding soil
 - Prevent infiltration of fill

 Alberta Transportation

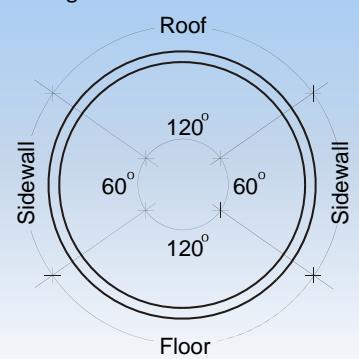

Technical Standards Branch
Class B Bridge Inspection Course
56

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Ring

- For round culverts, use approximate arcs shown
 - Use longitudinal seam if close

 Alberta Transportation

57

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel – Ring Defects

- Flexible Steel culverts look for:
 - Deformation (measure crest to crest)
 - Localized crimping or buckling
 - Longitudinal seam problems
 - Corrosion
 - Abrasions on floor
- Rigid Timber culverts look for :
 - Material defects – rot decay
- Rigid Concrete culverts look for :
 - Structural problems - cracking
 - Material defects - corrosion, scaling, freeze-thaw damage

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
58

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Roof

Flexible Culverts:

- Record lowest measured Rise in mm (crest-crest). Mark in culvert for future reference.
- Record Ring number measurements taken.
- If floor bulge occurs at same location add bulge to measured rise and explain in comments.
- Calculate and record Sag in mm (design –measured rise).
- Calculate and record % Sag.
- Rate Roof based on % Sag (Table 13.3) or other visual defects.
- If not able to measure Rise due to ice, silt, concrete floor, etc. a Roof rating is still required based on visual evidence and estimated sag.

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
59

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel – Roof Ratings

Flexible culverts - continued

- Presence of temporary repairs has no influence.
- Sag within 5% , no corrosion - rate 7
- Sag within 7% , no pitting - rate 5
- Sag within 10%, corrosion pitting – rate 4
- Sag 11-15%, isolated perforations – rate 3
- Sag >15%, roof flattening, reverse curvature , extensive perforations – rate 2.
- Reverse curvature in flat HE or round under low cover, severe perforations – rate 1.
- Consider Longitudinal Seam rating if in Roof.

Rigid Culverts:

- Rate Roof based on visual evidence, defects
- Measurements not required

 Alberta Transportation

Technical Standards Branch

Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Sidewall

Flexible Culverts:

- Record greatest measured Span in mm. (crest-crest). Mark in culvert for future reference.
- Record Ring number measurements taken.
- Calculate and record Deflection in mm (measured rise - design).
- Calculate and record % Deflection.
- Rate Sidewall based on % Deflection (Table 13.3) or other visual defects.
- If not able to measure Span due to size, ice, etc. a Sidewall rating is still required based on visual evidence and estimated deflection.

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
62

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel – Sidewall Ratings

- Deflection within 5% , no corrosion - rate 7
- Deflection within 7% , no pitting - rate 5
- Deflection within 10%, corrosion pitting – rate 4
- Deflection 11-15%, crimping or buckling, isolated perforations – rate 3 or less.
- Deflection >15%, crimping/buckling with plate shear, extensive perforations – rate 2 or less.
- Consider Longitudinal Seam rating if in Sidewall (e.g. - Longitudinal Seam in Sidewall rated 2 governs Sidewall rating).

Rigid Culverts:

- Rate Sidewall based on visual evidence, defects
- Measurements are not required

Culvert Inspection and Ratings

Barrel - Floor

- Note and record substrate type and %.
- Check timber floors for rot, missing sections.
- Check concrete floors for cracking, spalling, missing sections.
- Check steel floors for cracks, crimping/buckling, defective seams, corrosion, abrasion.
- Measure or estimate floor bulge and record ring number.
- For flexible culverts - If greatest floor bulge is occurring in same ring as worst roof deflection add bulge to measured Rise
- Indicate abrasion on floor by Yes or No. if yes provide comment.

Barrel - Circumferential Seams

Bridge Culvert Barrel			
Culvert Component	Last	Now	Explanation of Condition
Circumferential Seams			
Separation (mm)			

- Refers to seams joining individual rings or sections of culvert
- Found on most types of culverts
 - Bolted seams on SPCSP
 - Couplers on CSP or Riveted pipes
 - Joints in precast concrete
 - Construction joints in cast-in-place concrete

Alberta Transportation

Technical Standards Branch Class B Bridge Inspection Course 69

BIM Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Circumferential Seams

- Purpose
 - Join rings
 - Prevent infiltration of backfill
- Most common problems are separation caused by settlement or corrosion of couplers
 - Especially CSP and precast concrete (settlement)
- Potential for safety problem if void develops in fill
- Look for:
 - Separation
 - Loose or missing couplers (corrosion)
 - Bent or broken edges on the rings
 - Misalignment of rings
 - Infiltration of backfill
 - Voids in surrounding fill

Alberta Transportation

Technical Standards Branch Class B Bridge Inspection Course 70

BIM Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Circumferential Seams

- Record width of worst separation.
- Gap but no soil infiltration - rate 4.
- Gap with minor soil infiltration - rate 3.
- Void from loss of material due to soil infiltration - rate 2.
- Severe loss of material due to soil infiltration - rate 1.
- Cracking from over torqueing of bolts but no growth or problems – rate 5.
- Cracking due to roof sag rate 4 or less.
- May affect Roof, Sidewall or Floor rating if severe (2 or less).

Barrel - Longitudinal Seams

Longitudinal Seams		
Total No. of Cracked Rings	2	2 Cracks in both W & E sidewalls at R2-5 and R7.
Total No. of Rings with Two Cracked Seams	5	
Thickness of Steel Between Cracks (mm)	25	R11 is cracked where bolted correctly at W side.
Proper Lap (Y/N)	No	At ring 6, E sidewall.
Longitudinal Stagger (Y/N)	Yes	

- Applies to SPCSP and CSP riveted culverts
- All others, Rate "X"

Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
74

Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Longitudinal Seams

- Purpose
 - Join individual plates in ring
 - Transmit loads between plates
 - Approx. 75% bending strength of plates
- Indicate if all seams properly lapped by Yes or No
 - If No, provide comment
- Indicate if seams staggered by Yes or No
 - Within same arc only
 - At change of arc should not be staggered
 - If No provide comment
 - Most common problem is cracking
 - Especially on improperly lapped seams

78

BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Longitudinal Seams

Other Problems

- Poorly nested plates
- Improper fabrication and/or poor assembly
- Cusping
- Sharp break or discontinuity in curvature
- Occurs most often at longitudinal seams
- Improper fabrication , poor assembly/plate rotation during torqueing
- Improper backfill
- Bolt tipping
- High ring compression causing plate slippage and/or hole elongation
- Plate distortion
- High ring compression, improper assembly and backfill
- Corrosion

Barrel - Coating

Bridge Culvert Barrel			
Culvert Component	Last	Now	Explanation of Condition
(Pipe # : , Primary/Secondary Span, Location Code : , Span (mm) : , Rise (mm) : , Type :)			
Coating			
Corrosion By Soil (Y/N)			
(Corrosion by Water (Y/N)			

- Applicable to steel culverts only
- Applies mainly to zinc or aluminized coating
 - Can include other types - bituminous
- Purpose is to protect the steel from corrosion
 - Zinc & aluminum protect by sacrificial action

 Alberta Transportation

Technical Standards Branch
Class B Bridge Inspection Course
83

 BIM
Bridge Inspection and Maintenance

Culvert Inspection and Ratings

Barrel - Coating

- Corrosion can occur on soil or water side of culvert
- Soil side corrosion is generally visible above waterline and most common at seams
 - Can lead to perforations
 - Difference in backfill resistivity
 - Corrosive chemicals in backfill or water in fill
- Water side corrosion usually occurs in lower areas
 - Abrasion can remove protective coating
 - Water may have low pH or contain corrosive chemicals
 - Anaerobic bacteria may live in stagnant water

 Alberta Transportation

Fish Passage Adequacy-Bulletin #5

- Additional information is recorded for Fish Passage Adequacy for all W/C culvert sites.
- Multiple culvert sites - record for primary culvert only, or for the worst case culvert (from a fish passage perspective) when no obvious primary exists.
- Note if fish are observed in stream or in culvert
- Record information under the following:

Debris Blockage:

- If obstructed by debris record % of culvert diameter and the cause of obstruction.

Substrate in Culvert:

- Note if present and dominate type (sand, gravel, cobble, boulder, silt, other).
- Est. and note % of length that contains substrate.

Culvert Inspection and Ratings

Fish Passage Adequacy-Bulletin #5

Backwater in Culvert:

- U/S extension of standing water outlet pool into the culvert (Flowing water is not backwater).
- Estimate and record how far up into the culvert (% of culvert length from the outlet).

Outlet Pool Depth:

- Record depth of the pool to the nearest cm at the outlet .
- Take measurement within one culvert diameter of the end of the culvert.
- If outlet pool depth is highly variable, take several measurements and record the average.
